Hi Scott and Team,

We have reached agreement in principle with ODEQ's lab on the drinking water sample collection and analysis. EPA will collect the samples and DEQ's lab conduct the analysis. We will collect and analyze up to 3 batches (maximum of 60 samples including QA/QC samples) over a two-week period. We will work closely with DEQ and OHA on sample location identification, access agreements, QAPP develop, logistics and all the other details that go along with the field effort. I am also working on securing travel funding for the OEA sampling team. Elizabeth and I will keep you posted as we firm up the details.

Since this will likely come up on the call on Friday, here is a little more context. Manchester is not set up to run the same methods as DEQ's lab and it makes sense to have all of the drinking water samples analyzed at a single lab using the same methods. Also, the field work was going to significantly cut into DEQ's budget for the project which would have limited the number of samples they could collect and analyze. This arrangement seems to maximize the number of drinking water samples we can collect which is one of our objectives to try to determine how people are being exposed.

Please let me or Elizabeth know if you have any questions.

Sheila
